Activity: Ski-mountaineering

The MOUNTAIN SPRING

The company AlpControl was founded in 2007 to develop the MOUNTAIN SPRING, a removable tibia support that enables to ski with mountaineering boots.

The main part is made of carbon fibers that work like a spring, to give the same flex than a ski boot. It is supplemented by a dozen of titanium parts not to exceed 375 grams (0.82 lb) per foot.

Launched in late 2008, the MOUNTAIN SPRING has already been chosen by world-famous alpinists to open a new route in the Alps, for an attempt of speed record in Antarctica, to ski in Alaska (McKinley) and Himalayas (Cho-Oyu, Manaslu) ...

It also equips elite Units of Mountain Infantry and commandos of Special Forces.

It was a finalist in the ISPO New Brand Awards 2009.

The BLACK POWDER

The BLACK POWDER is a carbon fiber ski that only weights 1770 g (3.9 lb) per pair, it's a world record for 110 mm wide spatulas.

Its structure based on our "partial core" patent achieve this extreme lightness without sacrificing performance or durability, since it contains between 2000 and 3000 g/m² of high-end carbon fiber entirely woven into a triaxial fabric, a thick and ultra-resistant sole and 2.0 mm high edges allowing a large number of grindings.
